DETAILED ACTION

Allowable Subject Matter

1. Claims 1-2, 7, 9-10, and 12-13 are allowed over the prior art of record.
2. The following is an examiner's statement of reasons for allowance: the examiner agrees with applicant's arguments/remarks on pages 7-10 because the prior art of record fails to disclose " process of combining services to build a wireless mobile communication service utilizing by means of a graphical user interface or (GUI) to form a graphical representation of the wireless mobile communication in a flow chart style, wherein a built wireless mobile communication service, termed herein compound wireless mobile communication service or (CWS), consists of component services and a compiled said-CWS is enacted as a sequence of the said-combined services by a mobile station (MS) or and executed by a mechanism used to communicate to as aid MS, and such a built CWS can also be used as a component service to build another CWS thereby incorporating the property of recursion into the graphical building process, whereby the following building steps comprise a unique and a novel software process to build a said CWS." There is no indication in Dupray and/or Dove et al., that "to form a graphical representation of the wireless mobile communication in a flow chart style", and "a built CWS can also be used as a component service to build another CWS thereby incorporating the property of recursion into the graphical building process;" as substantially described in independent claim 1. These limitations, in combination with

the remaining limitation in claim 1 are not taught nor suggested by the prior art of record.

3. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Kodosky et al. (US Patent 6219628) teaches a system and method for configuring an instrument to perform measurement functions, wherein the instrument includes a programmable hardware element. A graphical program is first created, wherein the graphical program implements a measurement function. The graphical program may include a front panel and a block diagram. The method then generates a hardware description based on at least a portion of the graphical program. The hardware description describes a hardware implementation of the at least a portion of the graphical program. The method then configures the programmable hardware element in the instrument utilizing the hardware description to produce a configured hardware element. The configured hardware element thus implements a hardware implementation of the at least a portion of the graphical program. The instrument then

acquires a signal from an external source, and the programmable hardware element in the instrument executes to perform the measurement function on the signal. The front panel may be used by a user to control the instrument during the measurement.

Moore (US Patent 6377210) teaches an automatic mobile object locator apparatus and method provides position information and map data to user terminal equipment through a data communication network, such as the internet. A GPS receiver in mobile equipment attached to a vehicle which obtains global position information of vehicle which is transmitted through a communication network, including at least a wireless network portion, to a processor unit. The vehicle position information for like vehicles associated with one customer is stored in a customer specific database. Map data and position information are transmitted through the data network between the processor unit and user terminal equipment wherein a selected map and the location of a selected vehicle(s) are coupled and displayed to the user.

Dove et al. (US Pub 2004/0150667) teaches a graphical program may be created and configured to perform wireless communication. The user may include one or more wireless communication nodes provided by the graphical programming development environment in the graphical program. The wireless communication nodes may be operable to wirelessly send data to a remote computer system and/or may be operable to receive data sent wirelessly from the remote computer system. The graphical program may then be executed to perform the wireless communication.
